

AI Travel Planner Agent

Introduction

Travel planning is an important part of every trip, but it often requires users to search multiple websites for destinations, hotels, transportation options, budgets, and travel recommendations. This process can be time-consuming, confusing, and inefficient, especially for first-time travelers.

Problem Statement

Many travelers face difficulties in organizing their trips because travel information is scattered across different platforms. Users need a simple and intelligent solution that can generate personalized travel plans based on their preferences, budget, travel duration, and interests.

Objective

The objective of this project is to develop an AI-powered Travel Planner Agent that assists users in planning trips efficiently. The system generates customized travel itineraries, recommends hotels and transportation options, and provides useful travel tips through a conversational interface.

Proposed Solution

The proposed solution uses IBM watsonx.ai and Granite Foundation Models integrated with LangFlow to create an intelligent travel planning assistant. Users provide inputs such as source location, destination, budget, number of travelers, travel duration, and interests. The AI model processes these inputs and generates a complete travel plan including destination recommendations, hotel suggestions, transportation details, and day-wise itineraries.

Technologies Used

- LangFlow
- IBM watsonx.ai
- IBM Granite Foundation Model
- Python
- REST APIs
- JSON

Expected Outcomes

- Personalized travel recommendations
- Automated itinerary generation
- Budget-friendly travel planning
- Hotel and transport suggestions
- Improved user experience through conversational AI

Conclusion

The AI Travel Planner Agent simplifies the travel planning process by providing intelligent and personalized recommendations. By leveraging Generative AI and IBM Granite Models, the solution helps users save time, reduce effort, and make informed travel decisions.
